

Smile Design

We talked a bit today about how we can improve your smile. As we discussed there are many options available. When you think of your smile you need to think of a stage where the teeth are players. When you go to a show you take the entire stage into view and then, and only then, look at the individual players. Your smile is similar to a Broadway show!

The first thing we need to do is determine what your wants and needs are and then we can create a plan to design your new smile. Fortunately today we have numerous tools at our fingertips. Using the photographs we took at your initial examination visit along with examples from our Smile Design library we can sit and discuss with you what it is about your smile

Computerized Imaging

that you would like to change. We can then use computerized video imaging to actually make those changes and show you how they will affect your smile. We will pay particular attention to how the individual players (your teeth) are placed onto the stage (your new smile).

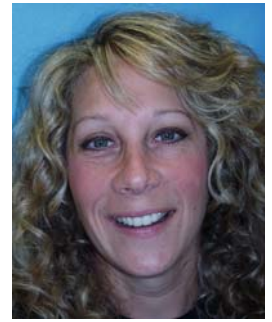

Once we have some idea of the desired changes we will send the casts taken at your clinical examination to our laboratory and have a customized, cosmetic waxup created. At a future visit we can sit and evaluate this wax replica of your new smile and make any desired changes. This wax template can then be used to fabricate the temporary veneers we will use while your new veneers are being created at the laboratory.

Porcelain veneers are thin, custom made porcelain replicas of the tooth you have always wanted. They look a bit like “fake fingernails”. These natural appearing veneers are bonded to your teeth to create your new smile. As you can see the creation of your veneers is a complicated but thorough process ensuring your total satisfaction. After all, we look forward to a long run for this new show and hope to be part of it for years to come.
